

Lesson takeaways

Lesson, module and course completed, high five!

👋 Some points to keep in mind:

★ The data science industry is growing quickly.
There are opportunities for everyone

★ Most of the technical roles require a solid
understanding of coding and statistics.

★ Other non-technical positions are a great way
to break into the industry.

Roles beyond data science positions

Coding skills are required for the technical data roles you learned about. There are also plenty of opportunities for people from non-tech backgrounds:

-  Data product manager
-  Data strategy consultant
-  Data ethicist
-  Technical writer

Taking one of these roles can be a great gateway to breaking into the data science industry.

Data Engineer

Data engineers lay the foundations for a smooth data analysis process. They manage the design and maintenance of the database architecture and data processing systems of a company.

Anyone interested in starting a career as a data engineer should start learning about SQL and a programming language like Python or Java.

Careers in data

Data has become one of the most important resources in the digital economy. Companies around the world are working to find the right talent to leverage the power of data. As a result, jobs in data have become in-demand and prospective careers.

Communicating and Presenting Results

The last step of the data analysis process is **communicating your findings**.

This is where your communication skills will come in handy. At this stage, **data visualization** and **data storytelling** will help you turn data insights into actions.

Data Cleaning

Data rarely comes in ready for analysis. Raw data is often messy and dirty. Some of the most common problems with data are:

-  Missing values
-  Duplicates
-  Incorrect data type
-  Handling anomalous and extreme values (also called **outliers**)

Collecting Data: APIs

Servers are databases that are always connected to the Internet. You can use an Application Programming Interface (API) to request information from servers.

Web APIs open a door to data from a third party platform over the Internet. There are APIs for Facebook, Youtube, Wikipedia and pretty much every other platform.

Collecting Data: Web Scrapping

There is a vast ocean of information on the Web. Web scraping allows you to extract information displayed on web pages.

There are software tools that can help you scrape the Web. If you know a bit about HTML and can code in a programming language like Python, you can get more control over the information that you can extract from the web pages.

Laura works in the data department of a German bank. She wants to analyze how popular the bank's mobile app is.

Which questions should Laura consider?

Select all correct answers.

Where will the data come from?

What metrics are going to be used to measure popularity?

Should Laura open a bank account in another bank?

Does Laura like the app?

The Data Analysis Process

The data analysis process defines the 5 steps required to analyze data:

- 🎯 Ask the right questions
- 🎯 Collect the data
- 🎯 Clean the data
- 🎯 Explore data to finding patterns and insights
- 🎯 Communicate and present results.

Patrice has downloaded geospatial data for the city of Barcelona, as well as the locations of English language academies. She noticed that there are some quality issues with the data. In particular, there are some duplicate academies in the records and some street names are very old and need to be replaced with new ones.

What would be the next step?

Explore data to find patterns and insights

Clean the data

Choose the right tool for each of the following situations:

Working with a single table:

spreadsheet

Dealing with complex relationships between data types:

database

ANSWER

CHECK

Databases vs Spreadsheets

You might have used spreadsheets like Excel to work with data before. How do they relate to databases?

Databases are better suited to store larger and more complex collections of data. Spreadsheets are useful for quick visualizations and summaries of data.

CONTINUE

The number of records in the tables is not shown in a database schema.

Why do you think this happens?

The number of records in a database is always the same

Databases are designed to store new records. The number of records changes as new data is added to the database

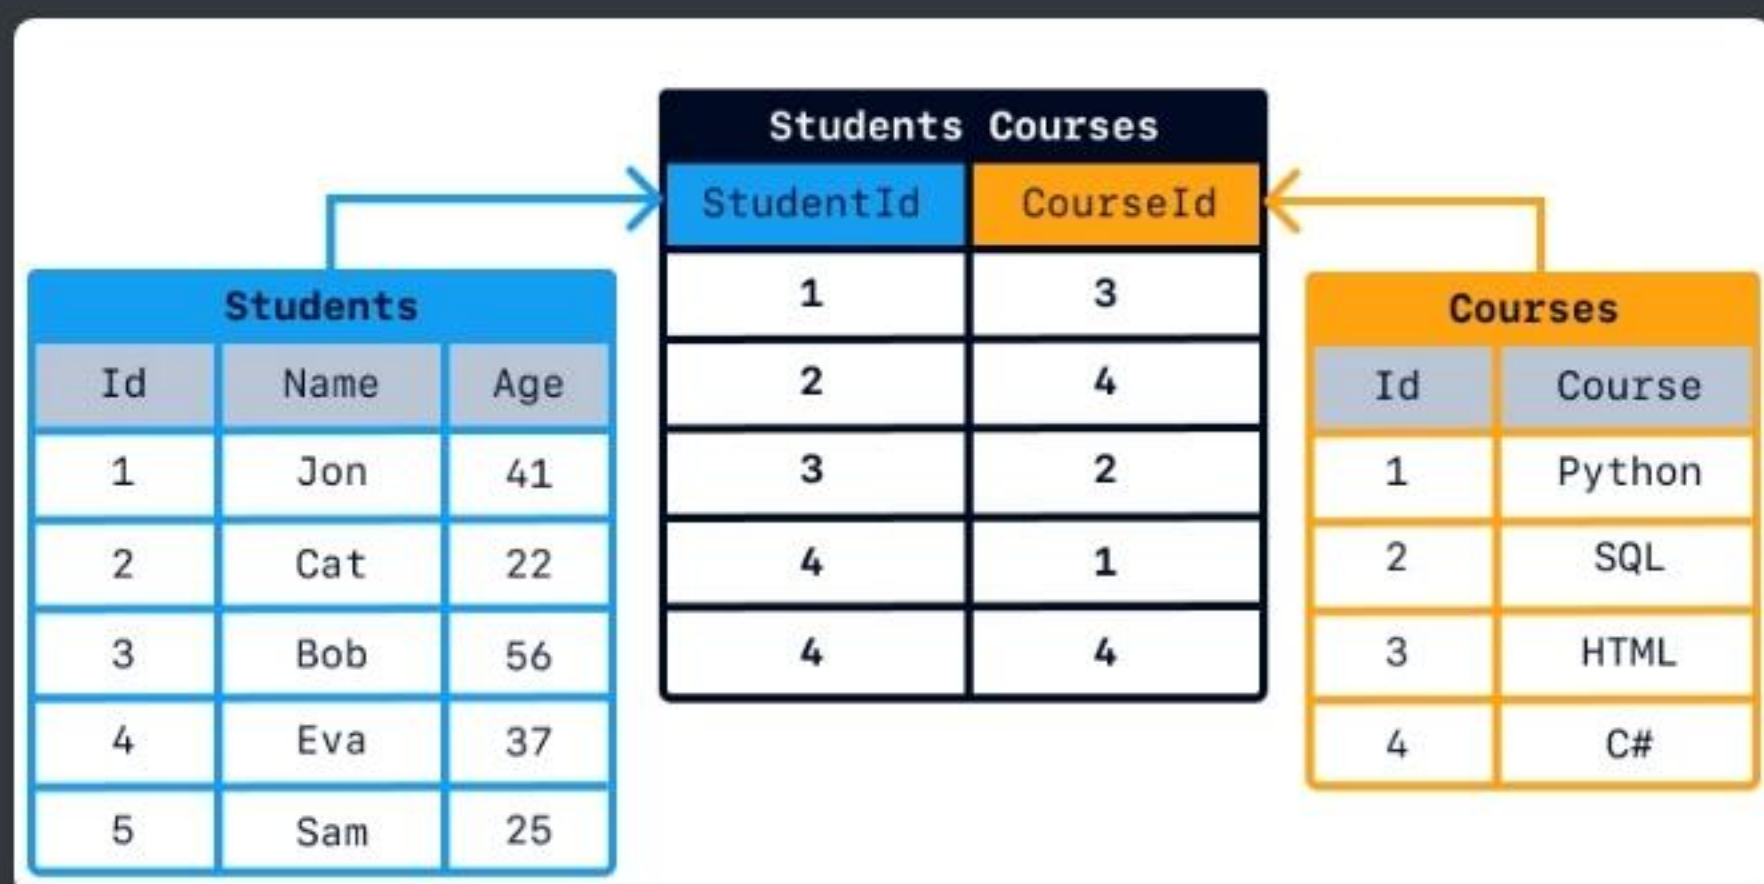

ANSWER

CHECK

Keys are used to connect the tables.

Which field in the **StudentCourses** table is used to connect to the **Courses** table?

CourseId

StudentId

ANSWER

CHECK

Databases

Databases store, organize and give easy access to data.

A **database** contains related data in an electronic format. The **relational database** is the most common type. Data in a **relational database** is stored in tables with rows (records) and columns (fields).
